

The DM-1000 series mobile radios are available in a portable mobile control station package. The mobile transceiver and mobile control head are integrated in an enclosure along with a 110-220 VAC power supply and 5 AH battery.

The battery allows the unit to operate for, on average, up to one hour without AC power, and also filters the power coming from the AC mains.

AVL position data received from mobiles may be connected by way of either USB or RS-232 serial ports to a PC computer running i2way D-Trac software.
