

iStat Status Display Program

The i2way iStat software application provides a simple to read display of the status of a fleet. User-defined status messages may be transmitted from mobiles with two keystrokes. Color-coded boxes indicate the importance of each of the received messages. The dedicated "emergency" button on a mobile or portable radio causes a red border on

a mobile's display box. The status of a radio's power switch is transmitted without operator intervention. Certain vehicle functions, such as the position of a boom on a bucket truck, may be sent and logged. All status messages, along with the appropriate unit number, time and GPS location, are logged on the i2way Logging Recorder.
